What's New

- New release: **V1.1** of Microdesk **BIMrx**.

New Features

- Simple select of Revit Entities with Revit rule-based filters.
- Extract Revit parameter data to Excel files with **One Tab per Revit Category** or **One Tab per Revit Family Type**.
- Import edit parameter data from Excel files.

Known Issues

- Revit elements that do not belong to a **Family with a Category** will **NOT** be exported (e.g. Building Elevations).
- **ElementId** fields exported as read only (e.g. Phases, Image).
- Elements without types are not being exported. E.g.: Rooms, Spaces, Views... and more
- Linked Models are not exported.
- Duplicate name parameters of the same type and category are not exported. E.g. Exterior Curtain Walls have two parameters, both named "Angle". One grouped under "Vertical Grid" and the other one under "Horizontal Grid". This parameter will not be exported.
- The Revit model must be saved before a BIMRX export operation.

Dependencies

- Revit 2016, 2017, 2018 or 2019.
- .NET 4.7
(<https://www.microsoft.com/en-us/download/details.aspx?id=56116>)

What's Ahead

Some of the future capabilities on the product roadmap are:

- Export the entire Model.
- Export all the requested data to one single Excel tab.
- Allow the selection of specific parameters for export.
- Support for Type Parameter updates.
