

Elevate **Revit** Project, Data & Document Management

Tailored for streamlining Autodesk Revit workflows, BIMrx Core improves project setup, data/model management and documentation processes for all disciplines.

This native integration is developed for project stakeholders seeking to reduce the low-value processes associated with BIM project delivery. BIMrx Core speeds up data entry and management then produces documentation for collaboration with Revit and non-Revit users alike.

From setting up sheets and managing views and Excel data to tagging elements, administrating revisions, and creating print sets, BIMrx Core is designed to work throughout your entire project lifecycle.

KEY FEATURES
